EXPLANATIONS

REGARDING PRONUNCIATION AND CHEMICAL SYMBOLS.

PRONUNCIATION.

In showing the pronunciation the simplest and most easily understood method has been adopted, that of re-writing the word in a different form. In doing so the same letter or combination of letters is made use of for the same sound, no matter by what letter or letters the sound may be expressed in the principal word. The key by this means is greatly simplified, the reader having only to bear in mind one mark for each sound.

The application of this key to the pronunciation of foreign words can as a rule only represent approximately the true pronunciation of those words. It is applicable, however, to Latin and Greek words, as those languages are pronounced in England.

Accent.—Words consisting of more than one syllable receive an accent, as the first syllable of the word labour, the second of delay, and the third of comprehension. The accented syllable is the most prominent part of the word, being made so by means of the accent. In this dictionary it is denoted by the mark '. This mark, called an accent, is placed above and beyond the syllable which receives the accent, as in the words la'bour, delay', and comprehen'sion.

Many polysyllabic words are pronounced with two accents, the primary and the secondary accent, as the word excommunication, in which the third, as well as the fifth syllable is commonly accented. The accent on the fifth syllable is the primary, true, or tonic accent, while that on the third is a mere euphonic accent, and consists of a slight resting on the syllable to prevent indistinctness in the utterance of so many unaccented syllables. Where both accents are marked in a word, the primary accent is thus marked", and the secondary, or inferior one, by this mark', as in the word excommu'nica''tion.

CHEMICAL ELEMENTS AND SYMBOLS.

By means of chemical symbols, or formulas, the composition of the most complicated substances can be very easily expressed, and that, too, in a very small compass. An abbreviated expression of this kind often gives, in a single line, more information as to details than could be given in many lines of letterpress.

When any of the above symbols stands by itself it indicates one atom of the element it represents. Thus, H stands for one atom of hydrogen, O for one atom of oxygen, and Cl for one atom of chlorine. (See Atom, and Atomic theory under Atomic, in Dictionary.)

When a symbol has a small figure or number underwritten, and to the right of it, such figure or number indicates the number of atoms of the element. Thus— O_2 signifies two atoms of oxygen, S_5 five atoms of sulphur, and C_{10} ten atoms of carbon.

When two or more elements are united to form a chemical compound, their symbols are written one after the other, to indicate the compound. Thus— H_2O means water, a compound of two atoms of hydrogen and one of oxygen; $C_{12}H_{22}O_{11}$ indicates cane-sugar, a compound of twelve atoms of carbon, twenty-two of hydrogen, and eleven of oxygen.

These two expressions as they stand denote respectively a molecule of the substance they represent, that is, the smallest possible quantity of it capable of existing in the free state. To express several molecules a large figure is prefixed, thus: $2\,H_2O$ represents two molecules of water, $4(C_{12}\,H_{22}\,O_{11})$ four molecules of cane-sugar.

When a compound is formed of two or more compounds the symbolical expressions for the compound are usually connected together by a comma; thus, the crystallized magnesic sulphate is $Mg\,SO_4$, $7\,H_2O$. The symbols may also be used to express the changes which occur during chemical action, and they are then written in the form of an equation, of which one side represents the substances as they exist before the change, the other the result of the reaction. Thus, $2\,H_2+O_2=2\,H_2O$ expresses the fact that two molecules of hydrogen, each containing two atoms, and one of oxygen, also containing two atoms, combine to give two molecules of water, each of them containing two atoms of hydrogen and one of oxygen.

Depend (de pend'), v.i. [L. depende, to hang down — de, down, and pendeo, to hang.]
1. To hang; to be sustained by being fastened or attached to something above: followed by from.

From the frozen beard Long icicles depend.

Dryden.

2. To be related to anything as to the cause of its existence or of its operation and effects; to have such connection with anything as a cause, that without it the effect would not be produced; to be contingent or conditioned: followed by on or upon; as, we depend on air for respiration.

Our happiness depends little on political institu-tions, and much on the temper and regulation of our own minds.

Macaulay.

3.† To be in the condition of a dependant or retainer; to serve; to attend.

'Do not you follow the young Lord Paris? 'Ay, sir, when he goes before me.' 'You depend upon him, I mean?'

4. To be in suspense; to be undetermined; as, the suit is still depending in court. See PENDING.—5. To rely; to rest with confidence; to trust; to confide; to have full confidence or belief: with on or upon; as, we depend on the word or assurance of our friends; we depend on the arrival of the mail.

First, then, a woman will or won't—depend on't; If she will do't, she will; and there's an end on't.

Aaron Hill.

6.† To hang over; to impend.

This is the curse depending on those that war for a placket. Shak.

Dependable (de-pend'a-bl), a. That may be depended on; trustworthy. 'Dependable friendships.' Pope.

We might apply these numbers to the case of giants and dwarfs if we had any dependable data from which the mean human stature and its probable deviation could be ascertained.

the mean human stature and its promise deviation could be ascertained.

Dependance, Dependancy (de-pend'ans, de-pend'an-si), n. Same as Dependence.
Dependant, Dependent (de-pend'art, de-pend'ent), n. 1. One who is at the disposal of another; one who is sustained by another, or who relies on another for support or favour; a retainer; as, the prince was followed by a numerous train of dependants.—2. That which depends on something else; a cousequence; a corollary. 'With all its circumstances and dependents.' Prynne. [It would perhaps be better if a distinction were uniformly made between dependant and dependent, as to some extent it is made, the former being more generally used as the noun, the latter as the adjective. We give the adjective under DEPENDENT.]
Dependence, Dependency (de-pend'en-si), n. 1. A state of hanging down from a support.—2. Anything hanging down; a series of things hanging to another.

Like a large cluster of black grapes they show, and the productive to the browth.

3. Connection and support; mutual connection; inter-relation; concatenation. 'A dependency of thing on thing.' Shak.

But of this frame the bearings and the ties,
The strong connections, nice dependencies. Pope.

other cause; inability to sustain itself without the aid of; as, we ought to feel our dependence on God for life and support; the child should be sensible of his dependence on his parents.—5. Reliance; confidence; trust; a resting on; as, we may have a firm dependence on the promises of God.

pendence on the promises of a sec.

Let me report to him

Your sweet dependency; and you shall find

A conqueror that will pray in aid for kindness.

Shak,

6. In law, the state of being depending or pending; the state of waiting for decision. An action is said to be in dependence from the moment of citation till the final decision of the House of Lords.' Bell.—7. That of which the existence presupposes the existence of something else; that which pertains to something else; an accident or quality; something ropressential something non-essential.

Modes I call such complex ideas . . . which are considered as dependencies, or affections of substances.

Locke.

8. The state of being dependent, subordinate, or subject to another: opposed to sovereignty.

So that they may acknowledge their dependency upon the crown of England.

Bacon.

upon the crown of England.

9. That which is attached to, but subordinate to something else; as, this earth and its dependencies.—10. A territory remote from the kingdom or state to which it belongs, but subject to its dominion; as, Great Britain has its dependencies in Asia, Africa, and America. [Dependency is the form exclusively used in this and the foregoing sense.]

11.† The subject of a quarrel, when duels were in vogue; the affair depending.

Your masters of dependencies, to take up A drunken brawl. Massinger.

Dependence is more used in the abstract, —Dependence is more used in the austract, and dependency in the concrete; thus, we say 'a question in dependence before a judge,' but 'a dependency of a state.'

Dependent, Dependant (de-pend'ent, depend'ent, a. 1. Hanging down; as, a dependent leaf.

The furs in the tails were dependent. Peacham.

2. Subject to the power of; at the disposal of; not able to exist or sustain itself without the will or power of; subordinate; as, we are dependent on God and his providence; an effect may be dependent on some unprover earse. known cause.

England, long dependent and degraded, was again a power of the first rank.

Macanday.

a Relying on for support or favour; unable to subsist or to perform anything without the aid of; as, children are dependent on their parents for food and clothing; the pupil is dependent on his preceptor for instruction. See DEFENDANT.

The supporters of this theory are divided into two chief sections, one holding that these rela-tions are completely embodied in the Holy Scriptures, but that our appreciation of

scriptural truth varies in every age, advanc-ing or retrograding in accordance with the advance or retrogression of the general in-telligence, while it may be increased by ap-propriation from the contributions to scriptural elucidation made at various times. The other section maintains that Scripture is tural elucidation made at various times. The other section maintains that Scripture is nerely the expression of the highest convictions of man's relations to the infinite and his consequent duties, attained at the date of its enunciation, and consequently that neither Scripture nor any other embodiment of religious belief can adequately express the conceptions of succeeding ages. (b) In biol. the theory that plants and animais are capable of advancing, in successive generations, and through an infinite variety of stages, from a lower to a higher state of existence, and that the more highly organized forms at present existing are not the result of special creations, but are the descendants of lower forms. Diagometer (di-ag-om'e-ter), n. [Gr. diago, to conduct, and metron, a measure.] An electrical apparatus used by Rousseau for ascertaining the conducting power of oil, as a means of detecting its adulteration. It consists of a dry pile, by means of which a current is passed through the oil, and the strength of the current is determined by a magnetized needle. Want of conducting power diminishes the current, and therefore the deviation of the needle.

Diagonal (di-agon-al), a. [Gr. diagonios,

fore the deviation of the needle.

Diagonal (di-agon-al), a. [Gr. diagonios, from angle to angle—dia, and gonia, an angle or corner.] 1. In geom. extending from one angle to the opposite of a quadrilateral figure, and dividing it into two equal parts.—2. Being in an angular direction.— Diagonal scale, a scale which consists of a set of parallel lines drawn on a ruler, with lines crossing them at right angles and at equal distances. One of these equal divisions, namely, that at the extremity of the ruler, is subdivided into a number of equal parts, and lines are

Dial (d'al), v.t. pret. & pp. dialled; ppr. dialling. 1. To measure with, or as with, a dial; to indicate upon, or as upon, a dial.

'Hours of that true time which is dialled in heaven.' Talfourd.—2. In mining, to survey by means of a dial.

Dialect (d'a-lekt), n. [Gr. dialektos, conversation, speech, from dialego, to conversedia, and lego, to speak; Fr. dialecte.] 1. The form or idiom of a language peculiar to a province or to a limited region or people, as distinguished from the literary language of the whole people, and consisting chiefly in differences of orthography or pronunciation. The Greek language is remarkable for four dialects.—the Attic, Ionic, Doric, and Eolic. A dialect is the

branch of a parent language, with such local modifications as time, accident, and revolutions may have introduced among descendants of the same stock or family living in separate or remote situations. But in regard to a large portion of words many languages which are considered as distinct are really dialects of one common torgue. are really dialects of one common tongue.

In many cases dialects exhibit more accurately the ancient form of this common tongue, and are less corrupted or modified than the literary language.—2. Language; speech or manner of speaking.

If the conferring of a kindness did not bind the person upon whom it was conferred, to the returns of gratitude, why, in the universal dialect of the world, are kindnesses still called obligations? South.

Dialectics, Dialectic (di-a-lek'tiks, di-a-lek'tik), n. (Gr. dialektike (technē), the art of discussing, from dialegō. See DIALECT.]—1. (In the first form.) The uame given to the art of reasoning or disputting, or that branch of logic which teaches the rules and modes of reasoning, or of distinguishing truth from error; the method of investigating the truth by analysis; also, the science of ideas or of the nature and laws of being. Later it came to signify the art of using forms of reasoning so as to make fallacies pass for ruth; word-fence.—2. (Also in the first form.) The logic of probabilities, as opposed to the doctrine of demonstration and scientific deduction.—3. (In the second form.) In tific deduction.—8. (In the second form.) In Kant's philos. the logic of appearance, as distinguished from universal logic, or that distinguished from universal logic, or that which teaches us to excite appearance or illusion. As logical or formal, it treats of the sources of error and illusion, and the mode of destroying them; as transcendental, it is the exposure of the natural and unavoidable illusion that arises from human mayondane musion that arises from human reason itself, which is ever inclined to look upon phenomena as things in themselves, and cognitions a priori as properties achering to these things, and in such way to form the super-sensible, according to this assumed cognition of things in themselves.

We termed Dialectic in general a logic of appearance. This does not signify a doctrine of probability is truth, only cognized upon insufficient grounds, and though the information it gives us is imperfect, it is not therefore deceitful.

Kant, translated by Meiklejohn.

Kant, translated by Meiklejohn.

4. (Also in the second form.) The method of dividing and subdividing, dissecting and analyzing a topic, so that we may be directed to the various lines of argument by which it may be approached, investigated, defended, or attacked: contrasted with logic, whose province it is to criticise these arguments, so as to reject the sophistical, and allow their exact weight to the solid. Taylor.

Art does not analyze, or abstract, or classify, or generalize; it does not lay bare the mechanism of thought, or evolve by the process of a rigid dialectic the secret order and system of nature and history.

dialysis. See DIALYSIS.

Dialyser, Dialyzer (dl'a-liz-èr), n. The parchment paper, or septum, stretched over a wood or gutta-percha ring used in the operation of dialysis.

Dialysis (di-a'li-sis), n. [Gr. dialysis, a loosing from anything, a separation; dialyō, to dissolve—dia, and lyō, to dissolve.] 1. A mark in writing or printing consisting of two points placed over one of two vowels,

to show that the two vowels are to be separated in pronunciation, as in aer: otherwise called Diverests.—2. In rhet. asyndeton (which see).—3. In med. debility; also, a solution of continuity.—4. In chem. the act or process of separating the crystalloid elements of a body from the colloid. This is done by pouring a mixed solution of crystalloid and colloid on a sheet of parchment paper stretched over a wood or gutta-percha hoop, having its edges well drawn up, and confined by an outer rim. The parchment is allowed to float on a basin of water. Diffusion immediately commences, parchment is allowed to float on a basin of water. Diffusion immediately commences, the crystalloid passing through and dissolving in the pure water beneath, whilst the colloid remains behind. Thus gruel or broth, containing a very little arsenic dissolved in it, gives up the whole of its arsenic to the water, whilst scarcely a trace of the organic substance passes through. As almost all the poisons in common use as assenic strictance passes among has a manosi anthe poisons in common use, as arsenic, strychnine, corrosive sublimate, oxalic acid, acetate of lead, morphia, &c., are crystalloids, the toxologist is by this process furnished with a very easy mode for detecting

their presence.

plamagnetic (di'a-mag-net"ik), a. [Gr. dia, and magnes, a magnet.] Pertaining to or exhibiting the phenomena of diamagnetism; a term applied to a class of substances which, term applied to a class of substances which, when under the influence of magnetism, and freely suspended, take a position at right angles to the magnetic meridian, that is, point east and west. From the experiments of Faraday it appears to be clearly established that all matter is subject to the magnetic force as universally as it is to the gravitating force, arranging itself into two great divisions, the paramagnetic and diamagnetic. Among the former are iron, nickel, cobalt, platinum, palladium, titanium, and a few other substances; and among the latter are bismuth, antimony, cadmium, copper, gold, lead, mercury, silver, tin, zinc, and most solid, liquid, and gaseous substances. When a paramagnetic substance is suspended freely between the poles of a powerful horseshoe magnet it points in a line from one freely between the poles of a powerful horse-shoe magnet it points in a line from one pole to the other, which Faraday terms the axial time. On the other hand, when a dia-magnetic substance is suspended in the same manner it is repelled alike by both poles, and assumes an equatorial direction, or a direction at right angles to the axial

2. A mineral, gem, or precious stone, of the most valuable kind, remarkable for its hardness, as it scratches all other minerals. When pure, the diamond is usually clear and transparent, but it is sometimes coloured, the colours being white, yellow, blue, green, black, &c. In its rough state it is commonly in the cc. In its roundish pebble, or of octahedral crystals. It consists of pure carbon. When placed between the poles of a powerful battery it is completely burned to carbon dioxide. When pure and transparent, diamonds are said to be of the first water, and as their transparency decreases they are classed as of the second and third water. The weight, and consequently the value, of diamonds is estimated in carats, one of of diamonds is estimated in carats, one of which is equal to 4 diamond grains or 3:174 grains troy, and the price of one diamond compared to that of another of equal colour, transparency, purity, form, &c., greatly increases with the weight. Thus, a diamond of 1 carat would bring about £21, while one of equal purity, form, &c., 2 carats in weight would bring about £80. Diamonds are valuable for many purposes. Their powder is the best for the lapidary and the gem engraver, and they are much used in the cutting of window and plate glass. They are also extensively used by copper-plate engravers as etching points, and by engineers for piercing rocks. (See DIAMOND-BORER.) The largest diamond known was found in S. Africa, weighing S71 carats, but with a large flaw in the centre. One of the most celebrated diamonds is the Kohi-noor, now belonging to the crown of Great Britain; celeprated diamonds is the Kon-i-noor, now belonging to the crown of Great Britain; it originally weighed, it is said, about 800 carats, but by subsequent recutting it has been reduced to 1032 carats. The Orlow diamond, belonging to the Emperor of Russia, weighs 195 carats; and the Pitt or Regent diamond, among the French crown reveals 1241. Dispropher or the control in numer. Regent diamond, among the French crown jewels, 1969. Diamonds are found in numerous localities in Hindustan, Malacca, Borneo, and other parts in the East. In America they occur in Brazil, North Carolina, and Georgia. They have also been found in Algeria, Australia, and latterly in large quantities in South Africa. Diamonds are cut into various forms, but chiefly into brilliants and rose diamonds or rosettes. The brilliant-cut best brings out the beauty of the stone, and is the most expensive and the stone, and is the most expensive and difficult; it has an upper or principal octagonal face, surrounded with many facets; the greater the number of facets, the more valuable the diamond. The rose-cut diamond has a flat base, above which are

Die-stock (di'stok), n. The contrivance by which the dies used in screw-cutting are held. It is of various forms.

Diet (di'et), n. [Gr. diwila, (1) a way of living; (2) a prescribed manner of life, diet; (3) a dwelling, abode.] 1. Food or victuals; as, milk is a wholesome diet; flesh is a nourishing diet.

Good broth with good keeping do much now and then;
Good diet with wisdom best comforteth men.
Tusser

2. Course of food regulated by a physician or by medical rules; food prescribed for the prevention or cure of disease, and limited in kind and quantity; as, I adhered strictly to the prescribed diet.

I commend rather some diet for certain seasons than frequent use of physic.

Bacon.

3. Allowance of provision.

For his diet there was a continual diet given him of the king of Babylon.

Jer. lii. 34.

Diet (di'et), v.t. 1. To feed; to board; to furnish provisions for; as, the master diets his apprentice. —2. To prescribe food for; to regulate the food or regimen of.

We have dieted a healthy body into a consumption by plying it with physick instead of food. Stoift. We shall not then have his company to night? Not till after midnight, for he is dieled to his hour.

Diet (di'et), v.i. 1. To eat according to rules prescribed; as, to diet for the removal of disease.—2. To eat; to feed.

Dietary (di'et-a-ri), a. Pertaining to diet or
the rules of diet.

Dietary (di'et-a-ri), n. A system or course
of diet; rule of diet; allowance of food, espectally that for the inmates of a prison,
poorhouse, and the like.

Lord Henry would not listen to statistics, dietary

tables, commissioners' rules, sub-commissioners' re-ports. Disraeli.

Diet-bread (di'et-bred), n. Bread medicated or regulated by a physician.

Diet-drink (di'et-dringk), n. Medicated liquor: drink prepared with medicinal ingredients.

Dieter (dl'et-er), n. One who diets; one who prescribes rules for eating; one who prepares food by rules. 'Sauced our brothe, as Juno had been sick, and he her dieter.'

Shak.

Dietetic, Dietetical (di-et-et'ik, di-et-et'ikal), a. [Gr. diantetikos, pertaining to diet,

Diffarreation (dif-fa'rê-ā''shon), n. [L. dif-farreatio—prefix dif, dis, and farreum, a spelt cake, from far, a sort of grain, spelt.]

The parting of a cake made of spelt: a ceremony among the Romans at the divorce of presented wife.

mony among the Romans at the divorce of man and wife.

Differ (differ), v.i. [L. differo—prefix dif, dis, and fero, to bear or move apart. See BEAR.]

1. To be unlike, dissimilar, distinct, or various, in nature, condition, form, or qualities; as, men differ from brutes; a statue differs from a picture; wisdom differs from folly.

One star differeth from another star in glory.

I Cor. xv. 41,

2. To disagree; not to accord; to be of a contrary opinion.

If the honourable gentleman differs with me on that subject, I differ as heartily with him. Canning. 3. To contend; to be at variance; to strive or debate in words; to dispute; to quarrel.

We'll never differ with a crowded pit.

Well never affer with a crowded pit. Keec.
[In the second sense differ is followed by
with or from; in the first sense almost
always by from.]—Syn. To vary, disagree,
dissent, dispute, contend, quarrel, wrangle.
Differ (differ), v.t. To cause to be different
or various. [Rare.]
Something 'its that differs me and thee. Cowley.

Differ (dif'fer), n. Difference. [Scotch.]

Ye see your state wi' theirs compared, And shudder at the nifler, But cast a moment's fair regard, What mak's the mighty differ.

Difference (differens), n. 1. The state of being different, discordant, or unlike; disagreement; want of sameness; variation; dissimilarity; change; as, there is a difference in nature between animals and plants; a difference in degrees of heat or of light.

She lived unknown, and few could know
When Lucy ceased to be;
But she is in her grave, and oh!
The difference to me. Wordsworth.

2. The quality which distinguishes one thing from another; the opposite of resemblance; as, on difference and its opposite, resemblance, scientific classification depends.

3. Dispute; debate; contention; quarrel; controversy.

What was the difference? It was a contention in public.

4. The point in dispute; ground of contro-

Are you acquainted with the difference That holds the present question in the court? Shak. 5. Evidences or marks of distinction. 'The marks and differences of sovereignty.' Davies.—6. The act of distinguishing; discrimination.

To make a difference between the clean and the unclean. Lev. xi. 47.

unclean. Lev. N. 47.

The remainder of a sum or quantity after a lesser sum or quantity is subtracted; the quantity by which one quantity differs from another.—S. In logic, the same as Differentia.

9. In her. a certain figure added to a coat of arms, serving to distinguish one family from another, or to show how distant a younger branch is from the elder or principal branch.—SYN. Distinction, dissimilarity, contrariety, dissimilitude, variation, diver-

sity, variety, disagreement, variance, contest, contention, dispute, controversy, debate, quarrel, wrangle, strife.

Difference (différens), v.t. pret and pp. differenced; ppr. differencing. To cause a difference or distinction in; to distinguish; to discriminate.

difference or distinction in; to distinguish; to discriminate.

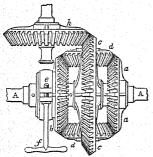

In Massinger the style is differenced, but differenced in the smallest degree possible, from animated conversation by the vein of poerry. Coleridge.

Different (different), d. 1. Distinct; separate; not the same; as, we belong to different churches or nations.—2. Various or contrary; of various or contrary natures, forms, or qualities; unlike; dissimilar; as, different kinds of food or drink; different states of health; different shapes; different degrees of excellence. [Different from is more correct than different to (as, the things are very different from each other), and the latter is to be avoided.]

to be avoided.]
Differentia (dif-fer-en'shi-a), n. In logic, the characteristic attribute of a species, or that by which it is distinguished from other species of the same genus; specific difference.

Whatever term can be affirmed of several things, must express either their whole essence, which is called the species; or a part of their essence (viz., either the material part, which is called the genus, or the formal and distinguishing part, which is called differentia, or, in common discourse, characteristic), or something joined to the essence. Whately,

or something joined to the essence. Whately,
Differential (dif-fer-en'shal), a. 1. Making
a difference or distinction; discriminating;
distinguishing; special. 'For whom he procured differential favours.' Motley.—2. In
math. an epithet applied to an infinitely
small quantity, so small as to be less than
any assignable quantity; pertaining to a differential or differentials, or to mathematical
processes in which they are employed.—
Differential calculus. See CALCULUS.—
Differential calculus the ratio of the

Differential Coupling.

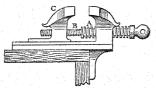

ling, in mach, a form of slip-coupling apling, in mach, a form of slip-coupling applied in light machinery for the purpose of regulating the velocity of the connected shaft at pleasure. It consists of an epicycloidal train, such as that represented by the annexed figure. The shaft A, through which the motive power is conveyed, is continuous, and the wheel a a is fast upon it, whereas those marked b and c are loose. The two ripinous Ad (only one of which is continuous, and the wheel a a is tast upon it, whereas those marked b and c are loose. The two pinions d d (only one of which is necessary) have their bearings in the wheel c c, and gear with the two wheels a a and b. Motion being given to the shaft a, the wheel b, which is loose, revolves in a direction contrary to the wheel a a, which is fixed, and the wheel c c remains at rest; but the motion of the wheel b being opposed by means of the friction-gland c, which can be tightened at pleasure by the screw f, the teeth of that wheel become fulera to the carrier-pinions d d, and these carry round the wheel c c, which, gearing with the wheel h on the second shaft, communicates motion to it of any degree of velocity not greater than half that of the driving-shaft.—Differential duties, in pol. ccon. duties which are not levied equally upon the produce or manufactures of different countries; as, when a heavier duty is laid on certain commodities from one country than on the same commodities from another. Such duties are also modities from another. Such duties are also called Discriminating Duties.—Differential getr, in mech. a combination of toothed wheels, by which a differential motion is produced—as exemplified when two wheels

fixed on the same axis are made to communicate motion to other two wheels on separate axes, the velocities of the latter mentate axes, the velocities of the latter axes differing proportionally to the difference of the diameters of the respective wheels acting upon them, or to their numbers of teeth. This combination is extensively employed in lattes and boring-machines.—Differential motion, in much. an adjustment by which a single combination is made to produce such a degree of velocity, as by ordinary arrangements would require a considerable train of mechanism practically to reduce the velocity. The Chinese or differential windlass is an example of this kind of motion. The two cylinders A and B, a little different in diameter, have a common axis, and the cord winds from the one upon the other when the axis is made to revolve, by which means a vertical motion is com-

motion is communicated to the pulley c equal to half the difference of the surface veloci-ties of the two cylinders A and
B; or equal to
the velocity that
would be obtained if the
centre of the pulley c were suspended by a cord wrapped round a single barrel, whose radius is half the

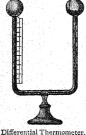

radii of the cylinders A and B. Thus, although theoretically a barrel with a radius equal to that difference would do as well as the double barrel, yet its diameter in practhe double barrel, yet its diameter in practice would be so small as to make it useless from weakness; whereas, the barrels of the differential combination may be of any diameter and strength necessary for the weights to be lifted. (See under WHIEL.) When a differential motion is effected by means of too thed wheels, the combination takes the name of differential gear (which see).—Differential screw, in mech., a compound screw, whereby a differential motion is produced—as exemplified by the annexed figure. at A and B being different, when motion is communicated to the screw, the piece of prevented from revolving) is made to slide parallel to the axis, by a quantity equal to the difference of the pitches of the two parts A and B in each revolution. Hunter's parametr to the axis, by a quantity equal to the difference of the pitches of the two parts A and B in each revolution. Hunter's screw (which see) is another example of the same kind.—Differential thermometer, an instrument for measuring very small differences of temperature, invented and first applied by Sir John Leslie. Two glass tubes, each terminating in a hollow ball, and having their bores somewhat widened at the other ends, a small portion of sulphuric acid tinged with carmine being introduced into the ball of one, are joined together by the flame of a blowpipe, and afterwards bent into nearly the shape of the letter U. are exposed to the same temperature, so that the instrument is affected only by the difference of heat of

the two balls. As long as both balls are of the same temperature the coloured liquid remains stationary; but if, for instance, the ball which holds a portion of the liquid be warmer than the other, the superior elasticity of the confined air will drive it forwards, and make it rise in the opposite branch above the zero, to an elevation proportional to the excess of elasticity, or of heat.

Differential (dif-fer-en'shal), n. In math. an infinitesimal difference between two states of a variable quantity. In the differential and integral calculus, if two or more quantities are dependent on each other, and subject to variations of value, their differentials are any other quantities whose ratios to each other are the limits to which the ratios of the variations approximate, as these variations are reduced nearer and nearer to zero. and nearer to zero.

Differentiate (dif-fér-en'shi-āt), v.t. 1. To produce, or lead to, a difference.

Believing that sexual selection has played an important part in *differentiating* the races of man, he has found it necessary to treat this subject in great detail.

A. R. Waltace.

2. To mark or distinguish by a difference; as, colour of skin differentiates the races of man.—3. To assign a specific act or agency to; to set aside for a definite or specific pur-

plose.

In zoology, the vital functions are said to be more and more differentiated, when, instead of several functions being performed by the same organ, each function is performed by an organ specially devoted to it.

4. In logic, to discriminate between, by observing or describing the marks of differentiation, or the differentia -5. In math. entiation, of the differential, or the differential coefficient of; as, to differentiate an equation. Differentiate (dif-fer-en'shi-nt), v.i. To acquire a distinct and separate character. Huxley.

Differentiation (dif-fer-en'shi-a"shon), Differentiation (differentiation), a. The formation or discrimination of differences or varieties. 'The mode of the differentiation of species.' Agassiz.—2. The assignment of a specific agency to the discharge of a specific function, as the assignment of a particular faculty in a university to the study and teaching of a particular branch of knowledge.

lar branch of knowledge. The Faculties arose by process of natural differentiation out of the primitive University. History.

3. In biol. the formation of different parts, organs, species, &c., by the production or acquisition of a diversity of new structures, through a process of evolution or development, as when the root and stem of a plant are developed from the seed, or of a piant are developed from the seed, or the leaves, branches, and flowers from the stem, or when animals, as they advance in type of organization, acquire, more and more, specific organs for the performance of specific functions, in place of one organ, as in the lower organisms, serving for heart, stomach, lungs, &c.; specialization.

Differentiation is, therefore, a mark of higher organization—the higher the animal in the scale of being, the more specialized is its organization.

Page. 4. In math the act of differentiating; the operation of finding the differential of any function.

Differently (different-li), adv. In a different manner; variously; as, men are differently affected with the same eloquence.

Differingly (differing-li), adv. In a different

manner.

Difficile (dif'fi-sil), a. Difficult: hard; scrupulous. 'The cardinal finding the pope difficile in granting the dispensation.' Bacon.

Latin was no more difficile,
Than to a blackbird tis to whistle. Hudibras.

Difficileness† (diffi-sil-nes), n. Difficulty; specifically, difficulty to be persuaded; impracticability; incompliance.

The lighter sort of malignity turneth but to a crossness, or frowardness, or aptness to oppose, or difficieness, or the like.

Eacon.

difficieness, or the like.

Difficult (diffi-kult), a. [From difficulty.]

1. Hard to make, do, or perform; not easy; attended with labour and pains; arduous; as, our task is difficult; it is difficult to persuade men to abandon vice; it is difficult to ascend a steep hill, or travel a bad road.—2. Hard to be pleased; not easily wrought upon; not readily yielding; not compliant; unaccommodating; rigid; austere; not easily managed or persuaded; as, a difficult man; a person of a difficult temper.—3. Hard to understand; occasioning labour or pains; as, a difficult passage in an author.—Arduous, Difficult, Hard. See under Arduous.—Syn.

Difficultly (diffi-kult-li), adv. Hardly; with difficulty. He himself had been only gully, and the other had been very difficulty prevalled on to do what he did. Difficulty, (diffi-kult-li), n. [Fr. difficulty. L. difficults, from difficul, old form of difficults and facilis—dis, priv., and facilis, easy to be made or done, from facio, to make or do.] 1. Hardness to be done or accomplished; the state of anything which renders its performance lahorious or perplexing: opposed to easiness or facility; as, the difficulty of a task or enterprise; a work of labour and difficulty. 2. That which is hard to be performed or surmounted; as, we often mistake difficulties for impossibilities; to overcome difficulties is an evidence of a great mind.

is an evidence of a great mind. The wise and prudent conquer difficulties by daring to attempt them.

Rowe.

3. Perplexity; embarrassment of affairs; trouble; whatever perplexes, or renders progress or execution of designs laborious.

More than once, in days of difficulty
And pressure, had she sold her wares for less
Than what she gave.

Tennyson.

4. Objection; cavil; obstacle to belief. 'Raising difficulties concerning the mysteries in religion.' Swift.—5. An embroilment; a serious complication likely to lead to a quarrel; a falling out; a controversy; a variance or quarrel. 'Measures for terminating all. difficulties.' Bancoft.—
SYN. Laboriousness, hardness, troublesomeness, obstacle, impediment, obstruction, embarrassment, awkwardness, perplexity, exigency, distress, trouble, trial, objection,

cavil.

Diffide (dif-fid'), v.i. [L. diffido — dis, and fido, to trust.] To distrust; to have no confidence. [Rare.]

The man diffide in his own augury And doubts the gods.

Dryden.

Diffidence (diff-dens), n. [L. diffidentia, want of confidence, diffidens, ppr. of diffidentia, to distrust—dis, priv., and fide, to trust. See FAITH.] 1. Distrust; want of confidence; any doubt of the power, ability, or disposition of others. tion of others.

To Israel, diffidence of God, and doubt In feeble hearts. Milton.

In feeble hearts,

More generally, distrust of one's self;
want of confidence in our own power, competency, correctness, or wisdom; a doubt
respecting some personal qualification;
modest reserve. 'An Englishman's habitual diffidence and awkwardness of address.'

Irving.

Be silent always when you doubt your sense;
And speak, though sure, with seeming dyndence. Pope.

— Bashfulness, Modesty, Difidence. See under
BASHFULNESS.—SYN. Distrust, doubt, fear,
timidity, apprehension, hesitation.

Diffident (diffn-dent), a. 1. Distrustful;
wanting confidence; doubting another's
power, disposition, sincerity, or intention.

'Piety so difident as to require a sign.' Bp.
Taylor.—2. Distrustful of one's self; not confident; doubtful of one's own power or competency; reserved; modest; timid; as, a
difident youth.

Distress makes the humble heart difficent

Distress makes the humble heart diffident.
Richard

Syn. Distrustful, suspicious, hesitating, doubtful, modest, bashful, reserved.
Diffidently (diffident-ll), adv. With distrust, in a distrusting manner; modestly.
Diffind (dif-find), v.t. [L. diffindo, to cleave.]
To cleave in two. Bailey. [Rare.]
Diffinitive + (dif-fin'it-iv), a. Definitive; determinate. Wotton. determinate. Wotton.

Diffission (dif-fi'shon), n. The act of cleaving

asunder. [Rare.]

Difflation (dif-fla/shon), n. [From L. difflo

to blow away.] A blowing or blasting to different parts. [Rare.]

Diffluence, Diffluency (diffly-ens, diffly-ens,), [See DIFFLUENT.] A flowing or falling away on all sides, the effect of fluidity, as opposed to consistency.

ley, as opposed to consistency.

Lee is water congrealed by the frigidity of the air, whereby it acquireth no new form, but rather a consistence or determination of its diffusercy.

Diffluent (diffingent), a. [L. diffuents, diffuentis, ppr. of diffuo, to flow in different directions—dis, asunder, and floo, to flow.]

Flowing away on all sides; not fixed.

Difflugia (dif-flu'ji-a), n. A genus of infusoria, inclosed in a case formed by the cosoria, inclosed in a case hesion of foreign bodies.

hesion of foreign bodies.

Difform (difform), a. [Fr. difforme, as if from a Latin adjective difformis—dif for dis, separate, and forma, shape.] 1. Irregular in form; not uniform; anomalous; as, a difform flower or corolla, the parts of which do not correspond in size or proportion; difform leaves.—2. Unlike; dissimilar.

The unequal refractions of difform rays. Newton. Difformity † (dif-form'i-ti), n. Irregularity of form; want of uniformity.

Just as seeing or hearing are not inequalities or aifformities in the soul of man, but each of them powers of the whole soul.

Clarke.

powers of the whole soul. Clarke.

Diffract (dif-frakt'), v.t. [L. diffringo, dif-fractum, to break in pieces—prefix dif, dis, and frango, to break.] To break in pieces; to bend from a right line; to deflect.

Diffraction (dif-frak'shon), v. [See DIF-FRACT.] 1. The act of breaking in pieces.—2. In optics, the peculiar modifications which light undergoes when it passes by the edge of an opaque body; deflection. Light, when it meets with no obstacle, proceeds in straight lines, but if it be made to pass by the boundaries of an opaque body ties turned from its rectilineal course.

Remarked by Grimaldi (1665) and referred by him to a property of light which he called diffraction.

Whewell.

Diffractive (dif-frakt'iv), a. Causing dif-fraction.

Diffractive (dif-fraktiv), a. Causing diffraction.

Diffranchise, Diffranchisement (dif-franshiz, dif-fran'shiz-ment). Same as Disfranchise, Disfranchisement.

Diffuse (dif-fuz'), v.t. pret. & pp. diffused;
ppr. diffusing. [L. diffundo, diffusum, to
pour in different directions, to spread—prefix dif, dis, and fundo, to pour.] 1. To pour
out and spread, as a fluid; to cause to flow
and spread; as, the river rose and diffused
its waters over the adjacent plain.—2. To
spread; to send out or extend in all directions. 'The pure delight of love by sound
diffused.' Wordsworth. 'A central warmth
diffusing bliss.' Tennyson.—Syn. To spread,
circulate, extend, scatter, disseminate, dispersed.—2. Copious; prolix; using many
words; verbose: said of speakers and writers
or their style.

or their style.

The reasoning of them is sophistical and inconclusive; the style diffuse and verbose. F. Warton. 3. In pathol. applied to diseases which spread widely and have no distinctively defined imits, as opposed to those which are circumscribed.—4. In bot. spreading widely, horizontally, and irregularly.

Diffused (diffuzd), p. and a. 1. Spread;

dispersed Diffused knowledge immortalizes itself.
Sir James Mackintosh.

Loose; flowing; wild. 'Diffused attire.'

Diffusedly (dif-fūz'ed-li), adv. In a diffused manner; with wide dispersion; wearing one's dress in a loose or neglectful manner.

Go not so diffusedly;
There are great ladies purpose, sir, to visit you.
Beau. & Fl.
Diffusedness (dif-fuz'ed-nes), n. The state

of being widely spread.

Diffusely (dif-fūs'li), adv. 1. Widely; extensively.—2. Copiously; with many words;

Diffuseness (dif-fūs'nes), n. The quality of being diffuse; specifically, in speaking or writing, superfluous wordiness, arising either from undue enumeration of non-essential or collateral details or redundant treatment of the main subject; want of due concentration or conciseness; prolixity.

Of COMMENSIONS, PROLECTION.

There is the learning, and the evidence of a wide desultory reading, as well as the diffuseriess of style that characterize his (De Quincey's) writings. Lancet.

His proclivity towards diffuseriess was exemplified by the abundance of his preliminary matter.

Diffusion (dif-fuzhon), n. 1. A spreading or flowing of a liquid substance or fluid in a lateral as well as a lineal direction; in a lateral as well as a lineal direction; as, the diffusion of water; the diffusion of air or light.—2. A spreading or scattering; dispersion; as, a diffusion of dust or of seeds.
3. A spreading; extension; propagation. 'A diffusion of knowledge which has undermined superstition.' Burke.—4. Copiousness; exuberance, as of style.—Diffusion of heat, a term employed to express the modes by which the equilibrium of heat is effected, viz. by conduction, radiation, and by convection.—Diffusion of gases. When two gaseous bodies which do not act chemically upon each other are mixed together in any relative probodies which do not act chemically upon each other are mixed together in any relative proportions they gradually diffuse themselves through each other; so that after a sufficient time has elapsed for the purpose, whatever may have been their relative densities, they are found intimately blended; the heavier gas does not fall, nor does the lighter one rise. —Diffusion of liquids. When two liquids that are capable of mixing, such as alcohol and water, are put in contact, they gradually diffuse one into the other in spite of the action of gravity. A mixture of alcohol and water occupies less space than the separate two liquids do, as if the molecular intersices of one or both of the liquids were partially filled by the other liquid. —Diffusion tially filled by the other liquid.—Diffusion volume, a term employed to express the difvolume, a term employed to express the different disposition of gases to interchange particles. Thus the diffusion volume of air is 1, and that of hydrogen gas 3:83.—Diffusion apparatus, an apparatus sometimes employed for extracting the sugar from cane or beet-root by dissolving it out with water.—Diffusion tube, an instrument for determining the rate of diffusion for different gases.—SYN. Extension, spread, propagation, circulation, expansion, dispersion.

Diffusive (dif.fūs'iv), a. 1. Having the quality of diffusing or spreading by flowing, as fluids, or of dispersing, as minute particles. Water, air, light, dust, smoke, and odours are diffusive.

—To dine out, to take dinner elsewhere
than at one's own residence. —To dine
with Duke Humphrey, to be dinnerless; a
phrase said to have originated from the
circumstance that a part of the public
walks in Old St. Paul's, London, was called
Duke Humphrey's Walk (being near his
tomb), and that those who could not pay
for a dinner at a tavern were accustomed
to promenade here in the hope of meeting
an acquaintance, and getting an invitation an acquaintance, and getting an invitation to dine. The phrase, however, may be con-nected with the report that Duke Hum-phrey, son of Henry IV., was starved to death

The principal meal of the day, in which respect it may be said to correspond with the deipnon of the Greeks and the coma of the Romans, both these meals being of the most elaborate kind and taken in the evening. In medieval and modern Europe the common practice, down to the middle of the last century, was to take this meal about mid-day. Since that time the hour of dinner has been gradually put back till it has reached from six to eight in the evening among the wealthire classes.

The Court dinner-hour, in the reign of George III.

among the wealthier classes.

The Court dinner-hour, in the reign of George III., was at the Hanoverian hour of four oclock. During the reign of George IV. it gradually crept up to six oclock, and finally became steady at the Indian hour of seven, and so remained until the reign of Her Most gracious Majesty, when the formal Court dinner-hour became eight o'clock. These innovations on the national hours of meals did not meet the approval of the medical faculty, and in consequence a dintette at two o'clock was prescribed. This has ever since been the favourite Court meal, being in reality a substantial hot repeat, which has exploded the old fashioned luncheon of cold viands.

The Queen.

2. An entertainment; a feast.

or level. The opposite of dip is the term rise, and either may be used according to the position of the observer; thus, a bed of coal which has a dip to the south when spoken of from the surface, will have a rise to the north when spoken of from the bottom of the mine. The term strike is often used in connection with dip, being the line or direction at right angles to the dip. See STRIKE.

If a stratum or bed of rock, instead of being quite level, be inclined to one side, it is said to dip; the point of the compass to which it is inclined is said to be the point of dip, and the degree of deviation from a level or horizontal line is called the amount of dip.

Diplacanthus (dip-la-kan'thus), n. [Gr. diyloos, double, and akantha, a spine.] A genus of fossil ganoid fishes occurring in the old red sandstone, characterized by very small scales, a heterocercal tail, and two dorsal fins, which, like the other fins, were armed with a strong spine in front. Dipleidoscope (di-pli'do-skōp), n. [Gr. diyloos, double, eidos, appearance, and skopeō, to see.] An instrument for indicating the passage of the sun or a star over the meridian, by the coincidence of two images of the object, the one formed by single and the other by double reflection. It consists of an equilateral hollow prism, two of whose sides are silvered on the inside so as to be mirrors, while the third is formed of glass. The prism is adjusted so that one of the silvered sides shall be exactly in the plane of the meridian, and the transparent side towards the object. So long as the object, has not reached the meridian, the image produced by that portion of the rays reflected directily from the glass surface, and that produced by the rays transmitted through the glass, are not coincident, but they gradually approach, as the sun or star approaches the meridian, until they exactly coincide at the instant the centre of the object is on the meridian; when an eye stationed at the side of the prism and looking to the transparent side sees only one object.

crumards of a nervous and sanguine temperament are liable to reduce themselves, and in which they manifest an uncontrollable craving for stimulants. In severe cases the moral powers are so weakened, and the mind so enfeebled, that the dipsomaniac is incapable of resisting the morbid impulse, which is also usually attended by ennui, irritability, painful sense of sinking at the epigastrium, and restlessness. The desire to appease this instinctive craving is, at last, imperative. When gratified, the patient becomes violent, maniacal, and dangerous to himself and to those around him. He continues to swallow the intoxicating fluids as long as he can procure them, or as long as he has the power of doing so, until the paroxysm terminates. Dipsomania is regarded by some as occurring likewise as a primary disease, the craving for drink being the accompaniment of moral perver-

sion, and is probably always indicative of some kind of physical disorder. Dipsomaniac (dip-sō-mā'ni-ak), n. A victim of the so-called disease dipsomania. Dipsomaniacal (dip-sō-mā'ni-ak-al), a. 3. In optics, the divergency of the rays of light, or rather the separation of the different coloured rays in refraction, aris-

ing from their different refrangibilities. The point of dispersion is the point where refracted rays begin to diverge. When a ray of the sun's light is made to pass through prisms of different substances it is found that spectra are formed of different lengths, which is occasioned by the prisms refracting the coloured rays at different angles. Thus, the spectrum formed by a prism of oil of cassia is found to be two or three times longer than one formed by a glass prism. The oil of cassia is therefore said to disperse the rays of light more than the glass, or to have a greater dispersive power. It is also found that in spectra formed by prisms of different substances the glass, or to have a greater unproposer. It is also found that in spectra formed by prisms of different substances the coloured spaces have not the same ratio to one another as the length of the spectra which they compose; and this property has been called the brationality of dispersion or of the coloured spaces in the spectrum.—4. The most common method of conducting the process of distillation consists in placing the liquid to be distilled in a copper vessel called the still, having a movable head from which proceeds a coiled tube called the xorn that passes through water constantly kept cold. Heat being applied to the still, the liquid in it is volatilized and rises in vapour into the head of the still, whence passing down the curved tube or worm it becomes condensed by the cold water, and vapour into vapour the read the sain, whence passing down the curved tube or worm it becomes condensed by the cold water, and makes its ext in a liquid state. This liquid consists of alcohol mixed with a large portion of water. It then undergoes the process of reetification, in which the spirit is concentrated and purified principally by means of re-distillation. Distillation is of great importance, not only in obtaining spirituous liquors, but also in procuring essences, essential oils, &c. Diving (div'ing), n. The art or act of descending into water to considerable depths, and
remaining there for a time. The uses of
diving are important, particularly in fishing
for pearls, corals, sponges, examining the
foundations of bridges, recovering valuables
from sunken ships, and the like. Various
methods have been proposed and engines
contrived to render diving more safe and
easy. The great object in all these is to
furnish the diver with fresh air, without
which he must either make but a short stay
under water or perish. See next article.

Divorce (di-vis/s), n. [Fr. divorce; L. divortium, a separation, a point of separation, a divorce, from divorto, a different orthography of diverto, to turn away. See DIVERT.] I. A legal dissolution of the bond of marriage. In England there were formerly two kinds of legal separation between man and wife called divorces; first, that a mensa et thoro (more correctly designated separation from bed and board), and pronounced, after due inquiry, by the spiritual courts; and secondly, divorce a vinctulo authrimonsi, or complete divorce, which could only be obtained by a special act of parliament for each case. In 1857 a special court for matrimonial causes was established, and by it divorces were granted without an act of parliament. In 1875 it was merged in the Probate, Divorce, and Admiralty division of the High Court of Justice in which divorce cases are now brought. The husband may get divorce on the ground of adultery, may get divorce on the ground of adultery,

but the wife must prove cruelty or desertion but the wife must prove cruelty or desertion as well. The court may also pronounce a decree of judicial separation; but such separation, although restoring to the wife full power over her property, does not entitle the parties to narry again. As to a decree nisi in a divorce case see under DECIFE. Besides adultery, cruelty, and desertion, the principal grounds for divorce are bigamy, rape, incest, &c. In Scotland the grounds of divorce are adultery by either party when of divorce are adultery by either party whe-ther coupled by desertion or cruelty or not, or wilful desertion for four years or more on the part of either husband or wife. The jurisdiction in divorce cases, by act Wm. IV. lxix., was given to the Court of Session. In the United States and some countries on the Continent, divorce can be obtained on much Comment, arroree can be obtained on much slighter grounds.—2. Separation; disunion of things closely united. Dog (dog), n. [This word hardly occurs in English till after the A. Sax, period (ab. 1220), and its history is doubtful. It is the same word as D. dog, Dan. dogge, Sw. dogg, all applied to large dogs of the mastiff or bull-dog kind. Hound (A. Sax, hund) was originally the English word for dog.] 1. A quadruped of the genus Canis (C. familiaris). The origin of the dog is a question most difficult of solution. Some think the breed is derived from the wolf, others affirm it to be a familiarized jackal; all agree that no trace of it is to be found in a primitive state, the dhole of India and dingo of Australia being wild descendants from domesticated ancestors. A satisfactory classification of the different kinds of dogs has not yet been arrived at, what some naturalists regard as types being regarded by others as mere mongrels. Colonel Hamilton Smith groups the domestic dog into six sections—(1) the wolf-dogs, including the Siberian, Esquimaux, Newfoundland, sheep, Great St. Bernard, &c.; (2) watch and cattle dogs, including the German boar-hound, Danish dog, dog of the North American Indians, &c.; (3) the grey-hounds, as the different kinds of greyhound,

Dog (dog), n. [This word hardly occurs in English till after the A. Sax, period (ab. 1220), and its history is doubtful. It is the same word as D. dog, Dan. dogge, Sw. dogg, all applied to large dogs of the mastiff or bull-dog kind. Hound (A. Sax hund) was originally the English word for dog.] 1. A quadruped of the genus Canis (C. familiaris). The origin of the dog is a question most difficult of solution. Some think the breed is derived from the wolf, others affirm it to be a familiarized jackal; all agree that no trace of it is to be found in a primitive state, the dhole of India and dingo of Australia being wild descendants from domesticated ancestors. A satisfactory classification of the different kinds of dogs has not yet been arrived at, what some naturalists regard as types being regarded by others as mere mongrels. Colonel Hamilton Smith groups the domestic dog into six sections—(1) the wolf-dogs, including the Siberian, Esquimaux, Newfoundland, sheep, GreatSt. Bernard, &c.; (2) watch and cattle dogs, including the German boar-hound, Danish dog, dog of the North American Indians, &c.; (3) the grey-hounds, as the different kinds of greyhound,

A term frequently used as synonymous with cromlech, but properly applied to one large where yet one recognition. unhewn stone resting on two or more un-hewn stones placed erect in the earth. The name is sometimes applied also to structures where several blocks are raised upon pillars so as to form a sort of gallery. The most remarkable monument of this kind is pro-

Constantine Dolmen, Cornwall

bably that known as the Pierre Couverte, near Saumur. It is 64 feet long, 14 feet wide, and about 6 feet high, and consists of four upright stones on each side, one at each end and four on the top. The dolmen repre-sented in accompanying cut consists of a vast stone 33 feet long, 14½ deep and 18½ across. This stone is calculated to weigh 750 tons, and is poised on the points of two natural rocks. It is now generally believed that dolmens were sepulchres, although afterwards they may have been used as altars. They are often present within stone circles. The dolmen was probably a copy of the first rude dwelling creeted by man, and sometimes may have been the actual structure in which he sheltered himself, converted afterwards into his tomb. In several cases one of the stones is pierced with a hole. This is supposed to have been for the purpose of introducing food to the dead. Conclusions in regard to the original identify of various races have been based on the similarity of such structures in various identity of various races have been based on the similarity of such structures in various parts of the world, as in Hindustan, Circassia, Algeria, and Europe; but too much import-ance may be attached to this, as the dolmen is really the structure which savages of a very low type, of whatever race, would natur-ally erect for shelter. See CROMLECH, MENHIE

MENHIN.

The second class is that of dataseus, too often called cromisches in this country. ... It may probably be assumed that the dataseu was originally a stone cities in the centre of a tumulus, meant to contain either one or more bodies. This afterwards was expanded into a chamber for the accommodation of several. In the third stage it was furnished with a passage or avenue of entrance so as to be permanently accessible. In the fourth stage the covering tumulus was dispensed with; but the last form most probably was when the datase mere ornament or simulated tomb. Quart. Rev.

Dominican (dō-min'ik-an), a. Of or pertaining to St. Dominic or the Dominicans.

Dominican (dō-min'ik-an), n. 1. A member of a religious order, instituted in 1216 at Touof a religious order, instituted in 1216 at Tou-louse, France, under the name of Frères prêcheurs (Predicants or Preaching Brethren or Friars) by Dominic de Guzman (after-wards St. Dominic), with the special purpose of combating the doctrines of the Albi-genses, against which this saint contended with great zeal. They were under the rule of St. Augustine, somewhat modified, and took a vow of poverty, receiving in 1272 the privileges of a mendicant order. Originally

Dominican or Black Friar

they were black friars, but subsequently they adopted a white serge tunic resembling that of the Carthusians, with a black cloak and pointed cap of the same colour. Within six years of their institution the order spread and pointed eap of the same colour. Within six years of their institution the order spread to England, and founded a monastery at Cxford, and they found a munificent patron in Alexander II. of Scotland. In France they were called Jacobins, because their first convent in Paris was built in the Rue St. Jacques. The Dominicans figure prominently in the history of the Inquisition, and a member of the order is always master of the Vatican, the interpreter of Scripture, and censor of books.—2. One of an order of cloistered nums founded by St. Dominic in 1206, following the same rule as the friars, but pledged to industry.—3. Dragon (dra/gon), n. [Fr. dragon; L. draco; Gr. drakon, from root drak or derk as in derkomat, to see; Skr. darc, to see. So called from its flery eyes. Dragon has entered modern English from the Fr., but it occurs in A. Sax. in the form draca, O.E. drake, from the Latin] 1. In nayth. a fabulous animal, conceived, physically, as a sort of winged crocodile, with flery eyes, crested head, and enormous claws, spouting fire, and, morally, as the embodiment of evil, of malicious watchfulness and oppression. The immediate source of the mediaval conception is no doubt the Scriptures, the conception being modified, however, first by the fact that in Welsh the word dragon was the highest glory of an English knight), and by the accounts brought home by Crusaders of the crocodiles they had seen in Egypt. The slaying of the dragon by St.

George is probably an allegory to express the triumph of the Christian hero over evil. The scriptural conception of the dragon was probably derived from Egypt; the Chinese dragon is probably an independent conception. In her, it is borne in shields, crests, and supporters. — 2. of man. Emerson. Hence—(a) the philosophical exposition of the nature of things by the adoption of two dissimilar primitive principles not derived from each other. Dualism is chiefly confined to the adoption of two fundamental beings, a good and an evil one, as is done in the oriental religions, and to the adoption of two different principles in man, viz. a spiritual and a corporeal principle. (b) In theol. the doctrine of those who maintain that only certain elected nersons are capable of admission to terms of those who manuan that only certain elected persons are capable of admission to eternal happiness, and that all the rest will be subjected to eternal condemnation. (c) Met, the doctrine of those who maintain the existence of spirit and matter as distinct substances, in opposition to idealism, which maintains we have no knowledge or assurance of the existence of surthing but our order. maintains we have no knowledge or assur-ance of the existence of anything but our own ideas or sensations. Dualism may correspond with realism in maintaining that our ideas of things are true transcripts of the originals or rather of the qualities inherent in them, the rather or the quanties inherent in them, the spirit acting as a mirror and reflecting their true images, or it may hold that, although produced by ontward objects, we have no assurance that in reality these at all correspond to our ideas of them, or even that they produce the same idea in two different minds.

Duel (dū'el), n. [Fr. duel, It. duello, from L.
duellum, old form of bellum, war, from duo,
two.] 1. Single combat; a premeditated
combat between two persons with deadly
weapons, for the purpose of deciding some combat between two persons with deadly weapons, for the purpose of deciding some private difference or quarrel. The origin of the practice of duelling is to be referred to the trial of battle which obtained in early ages. This trial by battle or duel was resorted to in accordance with the superstitious notions of the times, as a sure means of determining the guilt or innocence of a person charged with a crime, or of adjudicating a disputed right. It was thought that God took care to superintend, and to see that in every case innocence was vindicated and justice observed. The combat generally takes place in the presence of witgenerally takes place in the presence of witnesses called seconds, who make arrangements as to the mode of fighting, place the weapons in the hands of the combatants, weapons in the hands of the combatants, and see that the laws they have laid down are carried out. By English law fatal duelling is considered murder, no matter how fair the combat may have been, and the seconds are liable to the same penalty as the principals. Duelling is now practically obsolete in Britain.—2. Dynactinometer (di-nak'tin-om'et-er), n.

[Gr. dynamis, strength, aktis, aktinos, a ray, and metron, measure.] An instrument for measuring the intensity of actinic power, or for comparing the quickness of lenses.

Dynam (di'nam), a. A term proposed to express a unit of work equal to a weight of 1 lb. raised through 1 foot in a second; a foot-pound. The term was first introduced by Prench writers who called the effect of a

hot-pointd. The term was his introduced by French writers, who called the effect of a cubic metre of water raised through 1 metre a dynamic or dyname. If the quantity of work commonly called a horse-power be estimated at 33,000 lbs. raised through 1 foot in a minute, that unit will be equivalent to 550 dunams.

boo aynams.

Dynameter (di-nam'et-èr), n. [Gr. dynamis, strength, and metreō, to measure.] An instrument for determining the magnifying power of telescopes. It consists of a small tube with a transparent plate, exactly divided, which is fixed to the tube of a telescopic with the discount of the strength of the streng scope, in order to measure exactly the diameter of the distinct image of the eye-glass. Dynametric, Dynametrical (di-na-met'rik, di-na-met'rik-al), a. Pertaining to a dyna-

Dynamic, Dynamical (di-nam'ik, di-nam'ik-al), a. [Gr. dynamis, power.] 1. Pertaining to strength, power, or force; relating to dynamics.

Science, as well as history, has its past to show-past, indeed, much larger, but its immensity is mamic not divine. F. Martineau.

2. Relating to the effects of the forces or z. Kettaing to the effects of the forces or moving agencies in nature; as, dynamical geology. — Dynamical electricity, current electricity. See GALVANISM.— Dynamic theory, a theory by which Kant endeavoured to explain the nature of matter or the mode of its formation. According to this theory, all matter was originated by two antagonistic of the contract of the co an matter was originated by two antagonistic and mutually counteracting principles called attraction and repulsion, all the predicates of which are referred to motion. Dynamically (di-nam'ik-al-li), adv. In a dynamical manner.

dynamical manner.

Dynamics (di-namiks), n. [Gr. dynamis, force or power.] 1. The science which investigates the action of force. Force, when it acts on matter, is recognized as acting in two ways: first, so as to compel rest, or to prevent change of motion; and, secondly, so as to cause or to change motion. Hence the science of dynamics is divided into two hypothese to, which the perme statics and branches, to which the names statics and kinetics are respectively given. In popular usage, however, it has been customary to give to the science of force the name mechanics, in which case the branch which treats of force applied so as to compel rest or prevent change of motion is called statics, while that which considers force applied so as to cause or change motion is called aynamics.—2. The moving moral, as well as physical, forces of any kind, or the laws which relate to them.

The empirical laws of society are of two kinds; some are uniformities of coexistence, some of succession. According as the science is occupied in ascertaining and verifying the former sort of uniformities or the latter, M. Comte gives it the title of Social Statics or of Social Dynamics.

7. S. Mill.

Statics or of Social Dynamics. S. S. Mill.

8. In music, that department of musical science which relates to or treats of the force of musical sounds. Goodrich.—Geology which treats of the nature and mode of operation of all kinds of physical agents that have at any time, and in any manner, affected the surface and interior of the earth.

Dynamism (di'nam-izm), n. The doctrine of Leibnitz, that all substance involves force.

Dynamite (di'nam-it), n. [Gr. dynamis, strength.] An explosive substance consist-ing of a siliceous earth from Oberlole in Hanover impregnated with nitro-glycerine. The object of the mixture is to diminish the susceptibility of nitro-glycerine to slight shock, and so to facilitate its carriage without destroying its explosive force. The disruptive force of dynamite is estimated at about eight times that of gunpowder. Char-

about eight times that of gunpowder. Charcoal, sand, and saw-dust may be employed as substitutes for the siliceous earth.

Dynamo (di'na-mō), n. A dynamo-electric machine. See Electric in Supp.
Dynamometer (di-na-mon'et-ër), n. [See Dynamometer (di-na-mon'et-ër), n. [See Dynamometer especially that of men, animals, machines, &c. When the pull upon a draught implement, as a plough, is the point to be determined, the dynamometer is made a link in the draught chain, and then subjected to the tension which it is desired to ascertain. In such cases the instrument used is simply a spring; and by the amount of extension or collapse which it suffers the intensity of the strain which it has undergone is indicated. One of the has undergone is indicated. One of the most common dynamometers of this kind is formed of an elliptical spring, which in pro-portion to the longitudinal extension suffered when in use experiences a lateral collapse the measure of which indicates the collapse the measure of which indicates the amount of strain to which it has been subjected. In Clyburn's dynamometer the strain is indicated by the compression of a spiral spring inclosed in a cylindrical case, the extent of the strain being shown by an index moving along a scale on the outside of the instrument.

has made a cessio bonorum to his creditors.

Dzeren, Dzeron (dze'ren, dze'ron), n. The
Chinese antelope, a remarkably swift species of antelope (Procapra putturoso), inhabiting the dry arid deserts of Central Asia,
Thibet, China, and Southern Siberia. It is
nearly 4½ feet in length, and 2½ high at the
shoulder. When alarmed it clears 20 to
25 feet at one bound.

Dziggetai (dzig'ge-tā), n. The wild ass of
Asia (Equus hemionus), whose habits are so
graphically recorded in the book of Job, and
believed to be the hemionos of Herodotus
and Pliny. It is intermediate in appearance and character between the horse and
ass (hence the specific name hemionus, halfass), the males especially being fine animals,
standing as much as 14 hands high. It ass (hence the specific name nemionus, half-ass), the males especially being fine animals, standing as much as 14 hands high. It lives in small herds, and is an inhabitant of the sandy steppes of Central Asia, 16,000 feet above sea-level. Called also Kiang, Koulan, and Khur or Goor.

E.

E, the second vowel and the fifth letter of the English alphabet. It occurs more frequently in English words than any other letter of the alphabet, this frequency being partly owing to the fact that e has taken the place of the older (Anglo-Saxon) vowel endings a, o, and u. Its long or natural sound in English coincides with the sound strike the terrore of the control endings a, o, and w. Its long or natural sound in English coincides with the sound of i in the Italian and French languages, as in here, mere, me. It has also another principal sound, a short one, heard in met, men. It has besides a sound like a in name, as in there, where, &c., and the obscure sound which is heard in her. As a final letter it is generally silent; but it serves to lengthen the sound of the preceding vowel, or at least to indicate that the preceding vowel is to have its long sound, as in mane, cane, plume, which, without the final e, would be pronounced man, can, plume, Atter c and g the final e serves to indicate that these letters are to have their soft sounds, c being pronounced man cans, almost with without the final e in mace (mas) this word would be pronounced mac (mas) this word would be pronounced mac (mas) and rage (rāj) would be pronounced mac (mas) and rage (rāj) would be pronounced mac (mas) and rage (rāj) would he pronounced mac (nate), and rage (rāj) would he pronounced mac (nate), and rage (rāj) would he pronounced mac (nate), and rage (rāj) would segether the sound is generally the same as that of the single e long, as in deem, estem, need (comp. however pre-exist, &c.); and when it occurs with a and i, as in mean, hear, siege, deceive, it often has the same sound. Such a combination, when only one vowel sound is heard, is called a digraph. In these combinations the sound is usually that of e long, but sometimes it is the short sound of e, as in lead (pronounced edd), pret, of read, and some long, but sometimes it is the short sound of e, as in lead (pronounced led), a metal, read (pronounced red), pret, of read, and sometimes the sound of a long, as in reign, feign. Irregularities of this kind are not reducible to rules. See also under A.—As a numeral, E stands for 250.—In the calendar it is the fifth of the Dominical letters.—As an abbreviation it stands for East, as in charts; E. by S., east by south; in the abbreviative combination e.g., for exempti gratia, for example; and in i.e., for id est, that is.—E, in music, is the third note or degree of the

diatonic scale, answering to the mi of the Italians and French. Also, the key having four sharps in its signature; and the keynote of the church mode called Phrygian. E., A prefix, the same as ea; signifying from or out of, and in many words having a privative meaning. See EX.

2 t Traverses sourcess Fragment

knowledge, if not varily regulated, is often an hinderance to it. Locke.

2.f Tartness; sourness.—Eagerness, Earnestness, Avidity. Eagerness springs from an intense desire for the gratification of a strong emotion or passion, and tends to produce corresponding keenness in the pursuit of the object. Strictly, the term designs the feeling only, and although strongly stimulating to, eagerness does not necessarily involve, action. Earnestness is a more soher feeling, proceeding from reason, conviction of duty, or the less violent emotions. It has a special reference to effort, and does not necessarily imply desire for the attainment of an object. Thus we make earnest inquiries after the health of a friend, but eager inquiries after a person of whom we are in keen chase. Earnestness implies solidity, sincerity, and energy, and

conviction of the landableness of the object. Neither a flighty person, a hypocrite, nor a sluggard can be carnest in religion. Eurnestness is the more general term, and affects a person's whole character; eagerness is a specific feeling. An earnest mais eager only after what excites a specific desire. Avidity has regard to acquisition, either with the view of aggrandizing one's self or satisfying a natural craving. We cat, drink, or acquire learning with avidity, but the young soldier rushes to the fight with eagerness.—SYN. Ardour, zeal, vehemence, impetuosity, enthusiasm, heartiness, earnestness, fervour, avidity, greediness. Eagle (eigh) a. [Fr. aigle, Fr. aigle, L. aquila, an eagle, fem of the rare adj. aquilus, dark-coloured, swarthy.] 1. Aquila, a genus of raptorial birds, sub-family Aquilina, comprising the largest and most powerful members of the family Falconiad, distinguished from the falcons by the upper mandible being decurved from the end of the cere and not from the base, and the lip being destitute of teeth. The tongue is bird, the wings long and usually pointed, legs robust, claws curved, sharp and strong, and the tarsi fenthered to the very base of the talons, by which they are distinguished from the ernes or sea-eagles. There are numerous species, of which the noblest is the golden eagle (A. chrysaetos)

Golden Eagle (Aquila chrysaetos)

of Europe, found still in the more mountainous parts of Britain. The male is 3 feet, and the fernale 3½ feet long. It feeds chiefly on birds that live near the earth, and hares, rabbits, lambs, &c. Other species are the imperial eagle (A. imperialis), the spotted eagle (A. nævia), the Australian eagle (A. facosa), &c. The name eagle is applied to other members of the group, though not helonging to the genus Aquila, as the white-tailed sea-eagle of Britain (Haliactus albiculla), and the American white-headed sea-eagle (H. leucocephalus), the emblem of the United States, both of which are really ernes, and to the marsh eagle, harpy eagle, eagle-hawk of the genus Falco, &c. From its size, strength, rapidity of flight, and keenness of sight, the eagle has ever been regarded as the 'king' of birds. By the ancients it was called 'the bird of Jove,' and it was borne on the Roman standards. Many modern nations, as France under the and it was borne on the Roman standards. Many modern nations, as France under the Bonapartes, Russia, Prussia, Austria, the United States, &c., have adopted it as their national emblem. The organ of hearing, contained partly in the substance of the temporal bone, and partly projecting externally behind the joint of the lower jaw. In man and higher animals the ear is composed of the external ear, which is a cartilaginous funnel for collecting the sound waves and directing them inwards; of the drum of the ear, a bony cavity lined by mucous mem-

brane, separated from the external car by a delicate membrane, and containing a chain of small bones which transmit the vibrations of the latter to the internal car, in which are the terminal expansions of the auditory nerve. The internal car consists of a bony cavity, called the vestibule, which communicates with three semicircular canals, and with a bony structure in the form of a spiral shell, called the cochlea.

2. The sense of hearing, or the power of distinguishing sounds and judging of harmony; the power of nice perception of the differtinguishing sounds and judging of harmony; the power of nice perception of the differences of sound, or of consonances and dissonances, time and rhythm; as, she has a delicate ear for music, or a good ear.—3. Barl (erl), n. [A. Sax. eorl, a nobleman, a man of rank; same as O. Sax. erl, a warrior; Icel. Sw. and Dan. jarl, an earl; the origin of the word is unknown.] Among the British nobility, a nobleman, the third in rank, standing next below a marquis, and next above a viscount. The earl formerly had the government of a shire, and was called shireman. After the Conquest earls

were called counts, and from them shires have taken the name of counties. Earl is now a mere title, unconnected with territorial jurisdiction, so much so that several earls have taken as their titles their own names with the prefix Earl, as Earl Grey, Earl Spencer, Earl Russel. An earl's coronet consists of a richly chased circle of gold, having on its upper edge eight strawberry leaves, and between each pair a nearl raised on a were called counts, and from them shires

2. Being in good season; as, the court met at an early hour.—Early English architecture, the style of architecture into which the Norman passed, and the first in which no foreign influence is perceptible: called also the First Pointed or Lancet Style. Its period is from 1189 to 1807. Its general characteristics, as distinguished from the Norman, are delicacy, refinement, and grace. The columns and shafts become more slender and elegant, foliage in some instances sprouting out from the central pillar between the shafts; the mouldings are more delicactly rounded and alternated with hollows so as to give the finest effects of light and shade; the capitals frequently represent an inverted bell, and are often enriched with foliage, as of the trefoil, rising from the neck-moulding and coming beautifully outwards beneath the abacus; the towers are lofter and crowned by a spire; buttresses project boldly and vary little through entire length; roofs groined, with a ridge-rib added to the ribs of the Norman; wall-arcades very noble, their spandrels often filled with sculpiure. But the distinctive features of this style are pointed arches, long, narrow, lancet-shaped windows without mullions, and a peculiar projecting ornament in the hollows of the mouldings, called the dog-tooth ornament. Towards the end of the

period the windows became grouped in a manner that led to the development of tra-

cery, and so to the Decorated style.—SYN. Forward, timely, premature, precedous. Early (erll), adv. Soon; in good season; betimes; as, rise early; come early.

Those that seek me *early* shall find me.

Prov. viii. 17

Those that seek me early shall find me.

—Early, Soon, Betimes. Early is a relative word, and means that a certain event occurred before a definite point of time, which point is fixed by taking an average of the times at which such events commonly occur; thus, 'he rose early' means that he rose earlier than the average hour of rising; 'Come early in the evening'—come earlier than it is customary, or has been appointed for others, to come in the evening. Early is used as an adjective with the same sense; as, early fruit, i.e. fruit appearing before the average time when fruit appears. Soon is shortly after the present time, or after any fixed point; as, let me see you soon; soon after entering, he left. Betimes (by time)—in good time for some specific object or all useful purposes; as, he rose betimes.

Farnest (ern'est), n. [From W. crnes, an earnest of pledge, from crn, a pledge; allied to Gael. earlas, an earnest.] 1. In lawn, something given by the luyer to the seller, by way of token or pledge, to bind the bargain and prove the sale; a part, as of money or goods, paid or delivered beforehand, as a pledge and security for the whole, or in ratification of a bargain, or as a token of more to come hereafter; a handsel. In the law of Scotland, earnest is held as evidence of the completion of the contract; and the party who resiles, besides losing the earnest he has paid, may be compelled to perform his obligation. In ordinary cases the earnest paid is trifling in value, and is not taken into account in the reckoning.—2. Ear-ring (6r'ring), n. A pendant; an ornament, sometimes set with diamonds, pearls, or other jewels, worn at the ear, by means of a ring passing through the lobe. Among orientals ear-rings have been worn by both sexes from the earliest times. In England

they were worn by the Romanized Britons and by Anglo-Saxons. After the tenth century the fashion seems to have declined both in England and the Continent, and car-rings are neither found in graves nor discerned in paintings nor sculptures. The wearing of car-rings was re-introduced into England in the sixteenth century, and Stubbs, writing in the time of Queen Elizabeth, says, 'The women are not ashamed to make holes in their ears whereat they hang rings and other jewels of gold and precious stones.' In the seventeenth century earlings were worn by male fops. Earse (êrs), n. Same as Erse.

compose the mass of the globe, but more particularly the particles which form the mould
on the surface of the globe; any indefinite
mass or portion of that matter; as, we throw
up earth with a spade or plough; we fill a pit
or ditch with earth; we form a rampart
with earth. This substance being considered
by ancient philosophers as simple, was called
an element; and in popular language we still or ditch with earth, we form a rampart with earth. This substance being considered by ancient philosophers as simple, was called an element; and in popular language we still hear of the four elements—fire, air, earth, and water.—2. The terraqueous globe which we inhabit. It is one of the planets, and the third in order from the sun, its orbit embracing those of Mercury and Venus, but being within the orbits of all the other planets. The earth is endowed with two principal motions: first, a motion round its axis, from west to east, in twenty-four hours; and secondly, a motion of revolution round the sun. It is the first of these motions which produces the phenomena of day and night, and the apparent diurnal revolution of the heavenly bodies. The time in which the earth srotation is performed is measured by the interval which elapses between two transits of the same fixed star over the meridian of any place, and this interval is always precisely the same. It is called a sidereal day, and forms a perfectly uniform measure of time. The revolution of the earth about the sun is performed in an elliptic orbit, having the sun in one of the foci, and its mean distance from the sun, as calculated by Mr. Hind from Leverrier's determination of the solar parallax, is 91,322,600 miles. The time in which the earth about the sun is performed in an elliptic orbit, having the sun in one of the foci, and its mean distance from the sun, as calculated by Mr. Hind from Leverrier's determination of the solar parallax, is 91,322,600 miles. The time in which the earth speriorms a revolution in its orbit with respect to the fixed stars is 365 days, 6 hours, 9 minutes, 96 seconds. This is called the sidereal year. (See YEAR.) The plane which contains the earth's orbit is called the ecliptic. The earth's axis is inclined to this plane in an angle of 66° 32° 47°, whence the earth's equator is inclined to the ecliptic in an angle of 30° 20° 71° whence the earth's surface are overed with water; its mass compared with that of the sun is nearl

A shaking, trembling, or concussion of the earth; sometimesa slight tremor; at other times a violent shaking or convulsion; at other times a rocking or heaving of the earth. The earthquake shock generally comes on with a deep rumbling noise, or with a tremendous explosion resembling the discharge of artillery or the bursting of a thunder-cloud; the ground is raised vertically at the centre of the disturbed tract, but the movement is more oblique the farther we proceed from that centre; and the rate of increase of obliquity furnishes material for calculating the depth centre; and the rate of increase or ofliquity furnishes material for calculating the depth of the shock below the surface. (See SEISMOM MOVEMENTS, SEISMOMETER.) The single shocks of an earthquake seldom last more than a minute, but they frequently follow one another at short intervals for a considerable length of time. During these shocks have the stress that the ground. large chasms are often made in the ground, from which sometimes smoke and flames, but more frequently stones and torrents of water, are discharged. In violent earth-quakes these chasms are sometimes so ex-tensive as to overwhelm whole cities at once. tensive as to overwhelm whole cities at once. In consequence of these shocks, also, whole islands are frequently sunk, and new ones raised; the course of rivers is changed, and seas overflow the land. There is little doubt that earthquakes and volcanoes are due to that enrthquakes and volcanoes are due to the operation of a common cause, namely, the internal igneous forces of the earth. Probably the most destructive earthquake of modern times was that which nearly destroyed Lisbon in 1755, by which from about 30,000 to 40,000 persons are said to have perished, although it lasted only the short space of six minutes. No part of the earth is entirely free from the influence of earthquakes, and in South America in particular they are almost constantly occurring. The earthquake-wave, caused by the retiring and sudden recoil of the sea upon the land, causes perhaps as much destruction as the

spur. Ecarté (ä-kär-tä), n. [Fr., discarded.] A game of cards for two persons with thirty-two cards, the small cards from two to six being excluded. The English mode of playing the game differs slightly from the French,

and we give only the mode practised in this country. The players cut for the deal, which is decided by the lowest card. The dealer gives five cards to each player, three and two at a time, and turns up the eleventh card for trump. If he turns up a king, he scores one, and if a king occurs in the hand of either player he may score one by aunouncing it before the first trick. The cards rank as follows: king (highest), queen, knave, acc, ten, &c. Trumps take all other suits, but the players must follow suit if they can. Three tricks count one point, five tricks two points; five points make game. Before play begins the non-dealer may claim to discard (écarter) any of the cards in his hand, and have them replaced with fresh ones from the pack. This claim the dealer may or may not allow. Should he allow he can discard as many as he pleases. Sometimes only one discard is allowed.

to those of his master.

5. Deviating from stated methods, usual practice, or established forms or laws; fregular; anomalous; departing from the usual course; as, eccentric conduct; eccentric, virtue; an eccentric genius.—Excentric, Eucentric, Singular, Strange, Odd. Eccentric is applied to a person who does things in an extraordinary way, owing to his having tastes, judgment, &c., different from those of ordinary people. Eccentric implies that there is in the person spoken of a mental deviation from what is usual; thus,

we cannot speak of an eccentric body; but we speak of a person having an eccentric appearance, meaning an appearance indicating eccentricity, or resulting from eccentricity, as by being strangely dressed. Singular asserts that a thing is unique, or approximately so; strange [L. extroners, foreign], that it is unknown to the speaker; but what is strange to one man may not be so to another. What is strange to most, or to all, is singular. Odd, when applied to the person, infersingularity and grotesqueness; as, an odd figure. When applied to the mind it is nearly equivalent to eccentric, but is somewhat we cannot speak of an eccentric body; but we ngure. When applied to the mind it is nearry equivalent to eccentric, but is somewhat stronger, implying a slight degree of craziness; as, he is somewhat odd. When applied to actions and conditions, or their negation, it frequently implies some degree of wonder, and is nearly equal to surprising; as, it is odd that he should say so; it is odd he does not write.

Echinodermata (ê-kin'ō-dêr''ma-ta), n. pl. A class of invertebrated animals characterized by having a tough integument in which lime is deposited as granules (as in the star-fish and sea-cucumber), or so as to form a rigid test like that of the sea-urchin; and by the radial arrangement of all the parts of the adult, except the digestive system of the sea-urchin. A water system, usually communicating with the exterior, opens into the ambulacra or tubular feet, which are the locomotive organs, and are put into use by being distended with fluid. Their development is accompanied with metamorphosis, and the embryo shows a distinctly bilateral aspect. On this account, and because the adult arises as a secondary growth within the primitive embryo, the and because the adult arises as a secondary growth within the primitive embryo, the Echinodermata are now removed from the Cuvierian Radiata, and classed with the Scolecida in the sub-kingdom Annuloida. The sexes are distinct. The class is divided into seven orders—the Echinoidea (senurchins), Asteroidea (star-fishes), Ophinroidea (sand-stars and brittle-stars), Crinoidea (feather-stars), Cystidea (extinct), Blastoidea (extinct), and Holothuroidea (sen-cumbers). All are marine.

A sound reflected or reverberated from a solid body; sound returned; repercussion of sound; as, an echo from a distant hill.

The babbling echo mocks the hounds, Replying shrilly to the well-tuned horns, As if a double hunt were heard at once. Which makes appear the songs I made As echoes out of weaker times. Tennyson.

Which makes appear the songs I made As ecloses out of weaker times. Tempson. Sound being produced by waves or pulses of the air, when such a wave meets an opposing surface, as a wall, it is reflected like light and proceeds in another direction, and the sound so heard is an echo. When the echo of a sound returns to the point whence the sound originated, the reflecting surface is at right angles to a line drawn to it from that point. An oblique surface sends the echo of a sound off in another direction, so that it may be heard elsewhere, though not at the point where the sound originated. If the direct and reflected sounds succeed each other with great rapidity, which happens when the reflecting surface is near, the echo only clouds the original sound, but is not heard distinctly, and it is such indistinct echoes which interfere with the hearing in churches and other large buildings. An interval of about one-mith of a second is necessary to discriminate two successive sounds; and as sound passes through the atmosphere at the rate of about 1125 feet in a second, \(\frac{1}{2} \) of 1125, or about 62 feet, will be the least distance at which an echo can be heard. The wall of a house or the rampart of a city, the surface of a cloud, a wood, rocks, mountains, valleys, produce echoes. Some echoes are remarkable for their frequency of repetition.—2. In class. myth. a nymph, the daughter of the Air and Earth, who, for love of Narcissus, pined away till nothing remained of her but her voice.

Sweet Echo, sweetest nymph, that liv'st unseen Within thy airy shell.

Edda (ed'da), n. [Icel. great-grandmother. A name given to the book by Bishop Brynjulf Sveinsson, to indicate that it is the mother of all Scandinavian poetry.] A book containing a system of old Scandinavian mythology, with narratives of exploits of the gods and heroes and some account of the religious doctrines of the ancient Scandinavians. 'Saemund, one of the early Christian priests there (in Iceland), who perhaps had a lingering fondness for Paganism, collected certain of their old pagan songs, just about becoming obsolet there—poems or chants of a mythic prophetic, mostly all of a religious character; this is what Norse critics call the Elder or Poetic Edda. Edda, a word of uncertain etymology, is thought to signify Ancestress. Snorro Sturleson, an Iceland gentleman, an extremely notable personage, educated by this Saemund's grandson, took in hand next, mear a century afterwards, to put together, among several other books he wrote, a kind of prose synopsis of the whole mythology; elucidated by new fragments of traditionary verse. Education (ed-ù-kā'shon), n. [L. educatio.
See Educatra.] The bringing up, as of a child;
instruction; formation of manners. Education comprehends all that course of instruction and discipline which is intended to
enlighten the understanding, correct the
temper, cultivate the taste, and form the
manners and habits of youth, and fit them
for usefulness in their future stations. In
its most extended signification it may be
defined, in reference to man, to be the art
ef developing and cultivating the various
physical, intellectual, esthetic, and moral
faculties; and may thence be divided into
four branches—physical, intellectual, asthetic, and moral education. This definition is by no means complete; but it is used
merely as indicative of the manner in which
this subject has generally been discussed.
Under physical, education is included al this subject has generally been discussed. Under physical education is included all that relates to the organs of sensation and the muscular and nervous system. Intelthe muscular and nervous system. Intellectual education comprehends the means by which the powers of the understanding are to be developed and improved, and a view of the various branches of knowledge which form the objects of instruction of the four departments above stated. Astetic education comprehends the agencies which purify and refine the mind by training it to perceive and take delight in what is beautiful, true, and pure in nature, literature, and art, and to shrink from what is gross, lewd, and unlovely. Moral education embraces the various methods of cultivating and regulating the affections of the heart.

Education is not that which smothers a woman with accomplishments, but that which tends to consolidate a firm and regular character—to form a friend, a companion, and a wife. Hannah More.

Though her (Lady Elizabeth Hastings) mice car-ries much more invitation than command, to behold the san immediate check to loose behaviour; to lore her was a liberal education.

Eel(&l), n. [A. Sax. æl, L.G. al, Fris. iel, Dan. D. and G. aal. Grimm thinks it may be derived from an old word aha, meaning a serpent (Luther spells aal ahl), and allied to Gr. echis, Skr. ahi, a serpent, just as the L. anguilla, an eel, comes from anguis, a snake.] A family of teleostean fishes belonging to the apodal section of the Malacopterygii. The sub-genus Anguilla is characterized by its serpent-like elongated body, by the absence of ventral fins, and the continuity of the dorsal and anal fins round the extremity of the tail. The gill sit is at the base of the pectoral fins, and the opercular bones are small. The dorsal fin commences half-way between the head and the anal fin, and the lower jaw projects beyond the upper. In the sub-genus Conger the dorsal fin commences above the pectoral, and the upper jaw is the longer. The smoothness of the body—the scales being inconspicuous—and the serpentine movements are proverbial. Eels of the sub-genus Conger are exclusively marine. They sometimes weigh more than 100 lbs., and have a length of 10 feet; the species of Anguilla, which are both fresh-water and marine, seldom exceed 27 lbs. weight, and 30 inches in length. Eels are esteemed good food, and form an important article of commerce in some countries. The conger and at least three other species—the sharp-nosed (Aneuthrostris)—are found in this country. The so-called eels found in paste and vinegar are microscopic animals of the genus Vibrio. (See VIBRIO.) The term eel is applied to other fishes belonging to distinct genera. Electress (e-lekt/res), n. The wife or widow of an elector in the first German Empire.

Electric, Electrical (e-lek'trik, e-lek'trik, al), a. [Fr. electrique, from L. electrium, Gr. elektron, amber] 1. Containing electricity, or capable of exhibiting it when excited by friction; as, an electric body, such as amber and glass; an electric body, such as amber and glass; an electric in substance.—2. Pertaining to electricity; as, electric power or virtue; electric attraction or repulsion; electric fluid.—3. Derived from or produced by electricity; as, electrical effects or phenomena; an electric shock.—4. Conveying electricity; as, the electric wires; the electric evior electricity; as, the electric wires; the electric evior ist, a.—5. Fig. full of fire, spirit, or passion, and capable of communicating it to others.

Electric (ê-lek'trik), n. The old name for a body or substance capable of exhibiting electricity by means of friction or otherwise, and of resisting the passage of it from one body to another. See Electricity.
Electrically (ê-lek'trik-al-li), adv. In the manner of electricity, or by means of it. Electricalness (ê-lek'trik-al-nes), n. The state or quality of being electricial. [Rare.] Electrician (ê-lek-tri'shan), n. One who studies electricity, and investigates its properties by observation and experiments; one versed in the science of electricity.
Electricity (ê-lek-tris'i-ti), n. [See Electric]. [The name used in connection with an extensive and important class of phenomena, and usually denoting either the unknown cause of the phenomena or the science that treats of them. In the latter usage it may be defined as the branch of natural philosophy which investigates the attractions and repulsions, the production of light, and the elevation of temperature, as well as the explosions and other phenomena attending the friction of vitreous, resinous, and metallic surfaces, and the heating, cooling. explosions and other phenomena attending the friction of vitreous, resinous, and metallic surfaces, and the heating, cooling, evaporation, and mutual contact of a great number of bodies. The first knowledge of electricity was due to the following out the observation made by Thales, that amber, called by the Greeks electron, when rubbed, acquired the property of attracting light substances. It was subsequently observed that glass and various other substances, when rubbed, acquired the same property. If a dry glass rod be rubbed with a silk handkerchief, or a piece of amber or sealing-wax with a woollen cloth, and be presented to light bodies, such as fragments of ing-wax with a woollen cloth, and be presented to light bodies, such as fragments of paper, thread, cork, light straws, or little bits of gold-leaf, the light bodies are first attracted, but immediately after contact with the glass or sealing-wax they are again repelled. For example, if to a small pithball, formed from the pith of the elder-tree, suspended by a silk thread, we present the rubbed glass rod, we find the attraction is momentary, and is followed by as brisk a

repulsion, any attempt to bring the rod near to the pith only serving to drive it farther away. But if an excited stick of scalingwax be brought near, the pith instantly flies to it, only, however, to be in a moment cast off, as it had been by the glass before. Banished from the wax, it will now be received by the glass for an instant, a continual exchange of sympathy for the one or the other body being kent un as long as the tinual exchange of sympathy for the one or the other body being kept up as long as the excitement which gives rise to these phenomena continues. Again, if a second ball is brought near to the first, which has previously been in contact either with the wax or with the glass, attraction is first exhibited between the two balls and then repulsion. From these facts we learn that fricbrought near to the first, which has previously been in contact either with the wax or with the glass, attraction is first exhibited between the two balls and then repulsion. From these facts we learn that friction of glass with silk, or of sealing-wax with a woollen cloth, confers on these bodies new properties. They become excited or electrified. They have also the power of communicating their electrification to other bodies, and, again, a body electrified by either of them can electrify a third. There are two kinds of electrification, one like that of glass, and one like that of wax; hence the former has been sometimes called vitreous, and the latter resinous electricity. But these terms are not quite correct, as either kind may be got from the glass or from the wax by varying the nature of the rubber. For vitreous and resinous, the terms positive and negative are now usedpositive electricity being like that evoked on glass by rubbing with silk, and negative, like that evoked on sealing-wax by rubbing with flamnel. The experiment with the two balls shows that an electrified body communicates to another in contact with it electricity of the same sort as it possesses itself; and hence from this experiment, in connection with those that preceded it, we learn that similarly electrified bodies repel each other, and dissimilarly electrified bodies. Severy substance which we rub will not exhibit the phenomen of attraction and repulsion. A rod of metal held in the hand will show no trace of electricity, though it be rubbed ever so long. It is plain, therefore, that all bodies are not alike with regard to the electrical state. The difference used to be explained by saying that certain bodies, as amber, glass, resin, &c., were electrics; but such an explanation is erroneous, for if we hold the metal by a g termed insulators, because the electricity of an electric body which is surrounded by such, is prevented from escaping over other conductors. The earth is a great conductor of electricity. Besides friction there are other sources of electricity. After cleavage or pressure certain laminated minerals, as mica, arragonite, calcareous spar, exhibit strong electric excitement at the surfaces cleft or pressed, one of these surfaces being always positive, the other negative. Many other bodies, not minerals, possess the same property; thus, if a disc of cork and a disc of india-rubber be pressed together and then separated, the former is found to be electrified positively, and the latter negatively. Change of temperature produces electricity; thus, if a crystal of tournaline is warmed, it shows positive electricity at one extremity of its principal axis, and negative at the other. There are several other sources of electricity, as the motion of magnets (see MAGNETISM), the application of heat to a junction of two dissimilar metals (see THERMO-ELECTRICITY), and chemical action (see GALVANISM, GALTERM).

VANIC). Free electricity has the power of inducing the bodies near it to assume a peculiar electric condition; thus, if upon either extremity of a brass cylinder with rounded ends, insulated on a glass pillar, we hang two pith-balls by means of cotton threads, and place within a few inches of the end of the cylinder a glass tube which has been briskly rubbed, the balls at each end diverge, showing that each pair is charged with similar electricities. When the glass tube is withdrawn, the balls hang down as before, so that the electrical excitement of the cylinder is merely temporary and dependent on the proximity of the tube. This action of the tube, inducing in the cylinder its peculiar electrical condition, is called induction, and the cylinder in this state is said to be polarized, that is, to have its poles or ends like a magnet, each having its similar but relatively opposite force. (See Induction). its similar but relatively opposite force. (See Induction, Polarity.) Electricity, when accumulated in large quantities, becomes an agent capable of producing the most sudden, violent, and destructive effects in the control of the comes an agent capable of producing the most sudden, violent, and destructive effects, as in thunder-storms; and even in its quiescent state it is extensively concerned in the operations of nature. It is an important chemical agent, and its use has been lately much extended in the arts and manufactures. Many theories as to the nature of electricity have been proposed, but its real character is yet unknown. The two most important are the fluid theories of Franklin and of Symmers. Franklin held that all bodies, when in a neutral state, contain a definite quantity of an extremely elastic, imponderable fluid, which repels itself, but attracts matter. Bodies are positively electrified when they have more than their natural share of it, and negatively when they have less. Symmers' theory is that bodies, in the neutral state, contain equal amounts of two electrical fluids of opposite characters. By friction and otherwise these can be separated, one going to each body rubbed. Each repels itself but attracts the other, and one is peculiar to rubbed glass and the other to rubbed saling-wax.—Animal electricity, glaunism (which see).—Atmospheric electricity, the electricity which is produced in the atmosphere, and which becomes visible in the form of lighting. ning

Electrometer (ē-lek-trom'et-er), n. [Gr. ēlektron, amber (electricity), and metron, a measure.] An instrument for measuring differences of electric potential between two conductors through effects of electwo conductors through effects of electrostatic force, and distinguished from the galvanometer, which, of whatever species, measures differences of electric potential through electromagnetic effects of electric currents produced by them. (See POTENTALA). The most important instrument of this class is Sir W. Thomson's quadrant electrometer. Sir W. Thomson has also invented a portable electrometer and an absolute electrometer. vented a portable electrometer and an absolute electrometer. The latter consists essentially of two parallel circular plates attracting one another, one of them, the upper, suspended from one arm of a balance, the other being movable to a greater or less distance from the first by means of a micrometer screw. The upper disc is always brought to a fixed position (which can be very accurately determined) by means of the attraction being regulated by the distance between the two plates. It is thus seen that the electric force is actually weighed, and formulas are given by means of which the difference of potentials is deducible in absolute measure, the areas of the plates and the distance between them being known. Professor Dewar has introduced a very delicate electrometer based on the alteration of the force of capil-larity by electric action.

Electrometric, Electrometrical (ē-lek'-trō-met'rīk, ē-lek'trō-met'rī-kal), a. Per-taining to an electrometer, or the measure-ment of electricity; as, an electrometrical experiment

experiment.

Electro-motion (ë-lek'trō-mō-shon), n. The motion of electricity or galvanism, or the passing of it from one metal to another in a voltaic circuit; mechanical motion produced by means of electricity.

Electro-moting (ë-lek'trō-mō-tiy), a. Producing mechanical calcular motion, medicing mechanical calcular motion, mechanical calcular motion and mechanical motion

Electro-motive (e-lectro-mo-tiv), a. Pro-ducing electro-motion; producing mechani-cal effects by means of electricity; as, elec-tro-motive power.—Electro-motive force, the power which maintains electric currents. The strength of a current is directly pro-portional to the electro-motive force and inversely proportional to the resistance.

Ricetromotor (ë-lek'trō-mō-ter), n. [Fr. electromoteur.] 1. Any arrangement which gives rise to an electric current, such as a single cell, a galvanic hattery, or a thermoelectric pile.—2. An engine in which electricity is employed to produce mechanical effort.

Electron (ë-lek'tron), n. In recent chemical
and electric theory the name given to what
may be called a minute particle or corpuscle
of electricity, the belief being that the socalled atoms of matter, hitherto regarded as

indivisible wholes, are really complex aggregates of electrons, or at least owe their special character to electrons, a certain number—perhaps many thousands—of postive and negative electrons belonging to each atom, and by their relation to, or action on each other giving it its special nature. Electronic (ē-lek-tron'ik), a. Pertaining to electrons.

electrons.

Electro-negative (ê-lek'trō-neg"a-tiv), a.

Negatively electriic, repelled by bodies negatively electrified, and attracted by those positively electrified; having a tendency to pass to the positive pole in electrolysis.

Electrophone (ê-lek'trō-fōn), n. [Gr. ēlektron, amber (electricity), and phōnē, sound.]

A name given to a special application of the telephone by means of which speeches, dramatic or musical regitals, &c. are repromatic or musical regitals.

private houses. Electrophorus (ë-lek-trofo-rus), n. [Gr. elektron, amber (electricity), and phero, to bear.] An instrument for obtaining electricity by means of induction. It consists of a disc of resin, or some other material easily and the desired by the control of the cont

excited by friction, and a polished metal disc with an insu-lating handle. The resin disc is electrified by striking it or rubbing it with a catskin or flannel, and the metal plate

and the metal plate is then laid upon it. In these circumstances the upper plate does not receive a direct charge from the lower, but, if touched with the finger, receives an opposite charge by induction. On lifting it away by its insulating handle it is found to be charged, and will give a spark. It may then be replaced on the lower plate, and the process repeated an indefinite number of times without any fresh excitation if the weather is favourable.

Electroscope (ē-lek'trō-skōp), n. [Gr. ēlektron, amber (electricity), and skopeō, to view.] An instrument for observing or detecting the existence of free electricity, and, in general, for determining its kind. All in general, for determining its kind. All electroscopes depend for their action on the elementary law of electric forces, that bodies similarly charged repel each other, bodies dissimilarly charged attract. The simplest electroscope consists of a pair of short pieces of straw suspended by silk threads. When not in use the pieces of straw hang down, touching each other. On presenting an electrified body to them they become excited and stand apart, thus giving a test for electricity. This electroscope has been superseded by the gold-leaf electroscope of Bennet introduced in 1789. This consists of two prices of real leaf cheat being three discales. marounced in 1789. This consists of two pieces of gold-leaf, about \$\frac{1}{2}\$ inch broad, fixed to a brass rod and hung inside a glass globe, which has been thoroughly dried in order that the insula-

Chemists enumerate about seventy simple or elementary substances. The elementary supstances are usually any known chemical means. Chemists anumerate about seventy simple or elementary substances. The elements are usually divided into two groups, viz. non-metallic bodies and the metals. The non-metallic bodies and the metals. The non-metallic bodies are oxygen, hydrogen, nitrogen, carbon, chlorine, bromine, iodine, fluorine, sulphur, selenium, phosphorus, boron, and silicon. Arsenic, antimony, and bismuth are also sometimes classed among the non-metals. (See METALDID.) Berzelius classified these into metalloids, halogens, and gazolytes. The metalloids comprised sulphur, phosphorus, carbon, boron, resembling the metals in some respects, but differing widely in others, the halogens, chlorine, iodine, bromine, fluorine, characterized by entering into peculiar and distinct saline combinations; and the gazolytes, oxygen, hydrogen, nitrogen, then known only in the gaseous form, having never been solidified or liquefied. In this sub-classification two non-metallic bodies—selenium and silicon—do not appear. All the remaining fifty-one bodies are generally regarded as metals. (See METAL). The elements which

constitute the great mass of the earth's crust are comparatively few, viz. aluminium, calcium, carbon, chlorine, hydrogen, magcarcum, carbon, enforme, hydrogen, mag-nesium, oxygen, potassium, silicon, sodium, sulphur. Many of the recently-discovered elements, astellurium, ruthenium, thallium, cæsium, rubidium, indium, &c., occur in, very minute quantities, the discovery of the four last mentioned being due to spectrum analysis.

Elizabethan (ë-liz'a-beth"an), a. Pertaining to Queen Elizabeth. — Elizabethan architecture, a name given to the mixed or debased architecture of the times of Elizabeth and James I., when the worst forms of Gothic and debased Italian were combined, producing a singular heterogeneousness in detail with, however, wonderful picturesqueness in general effect, and domestic accom-modation more in accordance with the modation more in accordance with the wants of an advancing civilization than was afforded by the purer Gothic which preceded it. Its chief characteristics are: windows of great size both in the plane of the wall and deeply embayed, galleries of great length, tall and highly-decorated chimneys, as well as a profuse use of ornamental strapwork in the parapets, window-heads, &c. The Elizabethan style is the last stage of the Tudor or Perpendicular, and from its corresponding in point of period with the renaissance of the Continent has sometimes been called the English Renaissance. The epithet Jacobean has sometimes been given

an oval figure produced when any cone is cut by a plane which passes through it, not parallel to nor cutting the base. The ancient Greek geometers gave this name to the figure, because, among its other properties, one is, that the squares of the ordinates are less than the rectangles under the respective absenses and the parameter, or differ from them in defect. The ellipse ranks mext in importance to the circle. The paths which the planets describe in their revolutions round the sun are ellipses, the sun being placed in one of the foci. There are various methods of describing the ellipse upon a plain surface; sometimes this is performed by an instrument called the ellipsing an ellipse is by two pins and a string. At a given distance equal to twice the required eccentricity of the figure fix two pins, A and B, and pass a string A c B, having its quired eccentricity of the lighter in two plans, A and B, and pass a string A of B, having its ends tied together; keep the string stretched by a pencil or tracer c, and move this all the way round, keeping the string all the while equally tense, then the figure CGLFHE will

be an ellipse. A and B are called the foci; D, the middle point between them, the centre; DA or DB the eccentricity; EF, which passes through A and B, the major or transverse axis; GH, which passes through the centre and cuts EF at right angles, the minor or conjugate axis. If from any point L in the curve, a line LK be drawn perpendicular to the axis, it will be an ordinate to the axis, and EK and KF are said to be the abscisse corresponding to that ordinate. Also, any line drawn through the centre and terminated both ways by the curve is called a diameter. Ellipsis (el-lips's),n.; pl. Ellipsse(el-lips's2).
